

COMPRESSED AIR AUDIT

Problem: A customer had various leaks in their compressed air system, leading to electrical energy loss and increasing the compressor load. Project Technologies & Services (PTS) determined the customer was losing approximately \$50,000 per year.

Solution: PTS located and fixed the leaks in the system. We also determined using a small, jockey compressor would significantly reduce the electrical load by reducing how often the main, 150 horsepower compressor needed to start.

The project had a payback period of under 1 year.

PTS has performed numerous utility audits, often one of the easiest ways to reduce operation costs.
